# MOM for week (10-18 Feb)

This week meeting dealt with client along with some of the officials from his startup to review our progress.

We made a significant progress this week. We were asked to build a database schema according to the previous meet discussions. Along with it, we were asked to create a sample react project, and make API and UI for CRUD operations on the database. We successfully completed a part of the website, and the database schema was having some changes required as suggested by the client. These were the following changes:

1) Question data table and Questions table must be separated

2) We were asked to remove an extra key table, so that we could include everything in questions data table itself.

3) We were asked to remove some of the unnecessary attributed in tagging table.

4) We were to include an auto increment id for every table present, for easy access as requested by the client.

5) We got more conformation regarding the structure of the schema into which we are going to put the sample data, which will be provided in the next meeting.

6) We had changes in the connection between the two tables. The new schema photo has been uploaded.

7) We showed him how the functionality implemented is working on the database.
